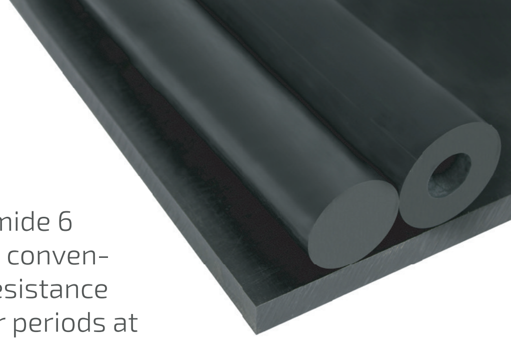
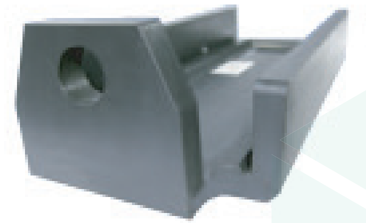
ERTALON® 6 XAU+



Semi-crystalline plastic, ERTALON® 6 XAU + is a heat-stabilized cast polyamide 6 with a very dense and highly crystalline molecular structure. Compared with conventional extruded and cast polyamides, ERTALON® 6 XAU + has a higher heat resistance (less degradation due to thermal oxidation), being able to work during longer periods at temperatures of 15 to 30ºC above the temperature of conventional polyamides.



MAIN CHARACTERISTICS

- Better wear and creep resistance
- Greater resistance to thermal ageing
- Very dense molecular structure
- Self-lubricating
- Excellent machinability
- Good sliding properties
- Good properties of electrical insulation
- High mechanical damping capacity
- Good resistance to high energy radiation (gamma rays and X-rays)

APPLICATIONS

- Bushings
- Mechanical parts subject to wear
- Specially recommended for mechanical parts subjected to wear at temperatures above 60ºC

+: values for dry material

++: values referring to material in equilibrium with the standard atmosphere 23ºC / 50% rh

(1) According to method 1 of ISO 62 and measured on ø 50x3 mm discs. **(2)** The elements supplied for this property are for the most part supplied by the manufacturers of the raw materials. **(3)** The values of this property are only attributed to amorphous rather than semi-crystalline materials. **(4)** Only for short periods of exposure in applications where only very low loads are applied to the material. **(5)** Temperature that resists after a period of 5,000 / 20,000 hours. After this time, there is a decrease of about 50% in tensile strength compared to the original value. The given temperature values are based on the thermal oxidation degradation which occurs which causes a reduction of the properties. In the meantime, the maximum permissible service temperature depends in many cases essentially on the deduction and magnitude of the mechanical stresses to which the material is subject. **(6)** As the impact strength decreases with decreasing temperature, the minimum allowable service temperature is determined by the extent of impact to which the material is subjected. The values given are based on unfavorable impact conditions and can not therefore be considered absolute limits. **(7)** These assessments derive from the technical specifications of the manufacturers of the raw materials and do not allow the determination of the behavior of the materials under fire conditions. **(8)** Most of the figures given by the properties of the (+) materials are mean values of the tests done on species machined with ø 40-60 mm. **(9)** Specimen testing: Type 1b. **(10)** Speed test: 5 or 50 mm / min. **(11)** Speed test: 1m / min. **(12)** Testing specimens: cylinders ø 8 x 16 mm. **(13)** Pendulum used: 15J. **(14)** Test on 10 mm thick specimens. **(15)** Electrode configuration: cylinders ø 25 / ø 75 mm, in transformer oil according to IEC 60296.

Note that the electrical force for the extruded black material can be considerably
lower than that of natural material. The possible micro porosity in the center of conserved forms in stock significantly reduces the electric force.
