TIVAR® DRYSLIDE

Semi-crystalline plastic, that thanks to the lubricant and the highest molecular weight is the material that offers the lowest coefficient of friction of the TIVAR® family and better resistance to wear and abrasion than TIVAR® 1000. The low coefficient of friction and its antistatic properties make TIVAR® DRYSLIDE an excellent material in harsh environments. The additives used also considerably improve the UV resistance.

MAIN CHARACTERISTICS

- Self-lubricating
- Extremely low coefficient of friction
- Excellent noise reduction
- Very high resistance to wear
- High resistance to impact
- Good chemical resistance
- UV resistance
- It does not absorb moisture
- Electro-static heatsinks
- Ideal for dusty environments
- Resistant to corrosion
- Anti-static

APPLICATIONS

- Curbs and guides for side chains
- Slide plates for conveyor belts
- High speed chain guides
- Guides for flat and trapezoidal belts at high speeds
- Sliding ramps
- Transmission and slip components
- Sliding components in elevators
- Bypass Bars
- Guide rollers and roller covers

*continuously (20.000H)

(1) Measured in 1 mm test pieces. **(2)** The figures given on these properties are for the most part derived from data from suppliers of raw materials. **(3)** Only for periods of short exposure (few hours) in applications where only little or no weight is applied to the material. **(4)** Temperature which it resists for a minimum period of 20,000 hours. After this time, there is a decrease of about 50% in tensile strength compared to the original value. The given temperature values are based on the thermal oxidation degradation which occurs which causes a reduction of the properties. In the meantime, the maximum permissible service temperature depends in many cases essentially on the deduction and magnitude of the mechanical stresses to which the material is subject. **(5)** As the impact strength decreases with decreasing temperature, the minimum permissible service temperature is determined by the extent of impact to which the material is subjected. The values given are based on unfavorable impact conditions and can not therefore be considered absolute limits. **(6)** These assessments are derived from the technical specifications of the manufacturers of the raw materials and do not allow the determination of the behavior of the materials under fire conditions. **(7)** Most of the figures given by the mechanical properties of the extruded materials are mean values of 30 mm-thick plate tests. **(8)** Testing of test pieces: Type 1B. **(9)** Speed test: 50 mm / min. **(10)** Speed test: 1 mm / min. **(11)** Testing of test pieces: cylinders ø 8x16 mm. **(12)** Pendulum used: 15J. **(13)** Pendulum used: 25J. **(14)** Measured on 10 mm thick test pieces. **(15)** Electrode configuration: ø 25 / 75mm coaxial cylinders; in transformer oil in accordance with IEC 60296; Test samples 1 mm thick.
